nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for verifying the propassion of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for proposing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this partent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1614 ATTITICCOTGCTTTTGACCTGCCTTCTTCCCCTTTCCTTTGGTTTTTGCATAG 1673

                                                                                                              The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular e.g. cardiovascular disease, hypertension, cardiac arrhythmias and e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleocide sequences given in the specification (or complements, fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                  192

                                    ö
                                                                                     The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory disease and the breast, fibrocystic changes, proliferative breast disease and noncarione tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel single exon nucleic acid probe used to measuring gene expression in a human breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Probe, human, breast disease, breast cancer, development disorder, ss, inflammatory disease, proliferative breast disease, non-carcinoma tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Penn SG,
                                                                                                                                                                                                                                                                                                                                                    RESULT
```

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from thuman lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes comprising frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes of the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung many, and (b) measuring the label detectably bound to each probe of the algorithmically predicting at least one exon from genomic sequences of the eularyote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several
                                                                                                                                                                                                                                                                                                                            Human, ds, single exon probe; asthma; lung cancer; COPD, ILD, chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histlocytosis; lymphangioleiomyomcosis; Karagener syndrome; pulmonary histlocytosis; lymphangioleiomyomcosis; Karagener syndrome; pulmonary histlocytosis; lymphangioleiomyomcosis; karagener syndrome; pulmonary distinary dyskinesis; plumonary hypertension; hyaline membrane disease; open reading frame; ORF.
                                                                                                                                                                                                                                                                                   Human genome-derived single exon probe ORF from lung SEQ ID No 13459.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Spatially-addressable set of single exon nucleic acid probes, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               measure gene expression in human lung samples.

tissues and/or cell types using hybridisation to a single exon
microarrays having a probe with the exon, where a common pattern of
microarrays having a probe with the exon, where a common pattern of
the exons should be assigned to a single gene, a peptide comprising one
of 12011 sequences, mentioned in the specification, or encoded by the
probes/open reading frames (ORP). The probes are used for gene expression
analysis, and for identifying exons in a gene, particularly using human
tung derived mRNA and for the study of lung diseases such as asthma, lung
cancer, chronic obstructive pulmonary diseases such as asthma, lung
disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
tuberous sclerosis, Gaucher is disease, Niemann-Pick disease. Hermansky-
pudlak syndrome, sarcoidosis, pulmonary alveolar proteinosis,
karagener syndrome, ibrocystic pulmonary alveolar proteinosis,
cancer, chronic obstruction and hyaline membrane disease. The
present sequence is a single exon probe open reading frame of the
present squence is a single exon probe open reading frame of the
the printed specification, but was obtained in electronic format directly
from WIPO at ftp.wipo.int/pub/published_pot_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Probe #1685 for gene expression analysis in human cervical cell sample.
The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           914 ATCTTTTCTAGAGAAATTAAGATCATTGAGTCATTGATGTTGAGAATTATCAATGAGCA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 1; Length 474;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from many of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing preast disease. Gene expression analysis is useful for eassessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring case expression, with far less bias then expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  914 ATCTTTTTCTAGAGAAATTAAGATCATTGAGTCATTGATGTTGAGAATTATCAATGAGCA 973

measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for present sequence is one such probe. The probes may be used for to measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             914 ATCTITITCTAGAGAAATTAAGATCATTGAGTCATTGATGTGAGAATTATCAATGAGCA 973

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                    Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, single exon nucleic acid probe, liver; cirrhosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancer such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                         The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS1105 represent human sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at IEEP.wipo.int/pub/published_pct_sequences
                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, particularly those diseases with polygenic aeriology. The diseases include: breast cancer, disorders of development, inflammatory diseases include: breast cancer, the sequence data for this patent disease and noncarcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to novel serine proteases designated BSSP4

(AABI1700-BI1709), and to nucleic acids encoding them (AAA61695-A61704,
AAA61799). The invention also relates to vectors and transformants

comprising BSSP4 nucleic acids, transgenic animals in which the
expression level of BSSP4 can be varied, and an mBSSP4 knockout mouse.

The invention additionally encompasses anti-BSSP4 antibodies and methods of production of such antibodies, methods of BSSP4 detection using the antibodies, and the use of BSSP4 proteins or fragments as diagnostic markers for certain medical conditions. Nucleotides encoding BSSP4 were initially isolated in a human brain cDNA library using degenerate PCR primers (AAA61715) based on conserved regions of serine proteases and nucleotides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological camples (e.g., blood, urine, brain, prostate gland and testis) as diagnostic markers for diseases associated with altered BSSP4 expression levels. Such diseases include Alzahemer's disease, ocedema (dropsy), cancer or inflammation of brain, prostate, testis or bone. Sequences
AAA61695-A61703 ans AAA61799 represent cDNAs encoding murine contains mutane (BBSSP4), and sequence AAA61704 represents CDNA encoding murine
                                                                                   BSSP4; serine protease; human; hBSSP4; mouse; mBSSP4; brain; diagnostic marker; antibody; transgenic animal; Alzheimer's disease; oedema; dropsy; cancer; inflammation; prostate; testis; bone; ss.
                                            cDNA encoding human serine protease BSSP4 (hBSSP4) SEQ ID NO:5.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               BSSP4 (mBSSP4)
                                                                                                                                                                                     Homo sapiens.
                                                                                                                                                                                                                                                                                                                          19-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                        20-NOV-1998;
                                                                                                                                                                                                                                                                             02-JUN-2000.
    The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12819 open reading frames derived from the 15614 probes. Also included are a microarray comprising the novel set of probes in the human lung, manually expressed in the human lung, measuring gene expression in a sample derived from human lung, measuring gene expression in a sample derived from human lung, measuring gene expression in a sample derived from human lung mRNA, and (D) measuring the label detectably bound to each probe of the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, in dentifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (D) detecting specific hybridisation of detectably having a fragment identical to the predicted exon, the probe is included comprising (a) identifying exons from equomic sequence by the method above and (D) measuring the expression of each of the exons in the tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single exon analysis, and for identifying exons in the tissues and/or cell types using plyridisation to a single exon analysis, and for identifying exons in the specification, or encoded by the exons should be assigned to a single gene; a peptide comprising of probes/oper raading frames (ORF). The probes are used for gene expression of each exist and for identifying exons in a gene, particularly using human cancer, chronic obstructive pulmonary diseases such as asthma, language derived mRNA and for the study of lung derived mRNA and for the study of lung derived mRNA and for the study of lung derived manualial idiopathic pulmonary har
                                                                                                                                                                                     Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 474 BP; 121 A; 114 C; 119 G; 120 T; 0 U; 0 Other;
                                                                                                                                                                                                              measure gene expression in human lung samples.

                                                                                                                                                                                                                                                The present invention relates to mutants of blood coagulant factor VII (FVII) or activated blood coagulant factor VII (FVIIa). The present sequence is the coding sequence for one such mutant FVII: VII-39. The mutants can be used as an agent for the substitution therapy of haemophilia inhibitor patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mutant of blood coagulant factor VII, used for substitution therapy in the treatment of hemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to mutants of blood coagulant factor VII (FVII) or activated blood coagulant factor VII (FVIIa). The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to mutants of blood coagulant factor VII (FVII) or activated blood coagulant factor VII (FVIIa). The present sequence is the coding sequence for one such mutant FVII: VII-31. The mutants can be used as an agent for the substitution therapy of haemophilia inhibitor patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                            Mutant of blood coagulant factor VII, used for substitution therapy

sequence is the coding sequence for wild-type human FVII. The mutants can be used as an agent for the substitution therapy of haemophilia inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to mutants of blood coagulant factor VII (FVII) or activated blood coagulant factor VII (FVIIa). The present sequence is the coding sequence for one such mutant FVII: VII-5. In the wild-type protein (AAB8466), there is a disulphide bond (159Cys-164Cys). In VII-5, the disulphide bond is disrupted. The mutants can be used as an agent for the substitution therapy of haemophilia inhibitor patients

The invention relates to a cell-free, in vitro method of remodeling a peptide. The method involves removing a saccharyl subunit from the peptide. The method involves removing a saccharyl subunit from the conflue forming a truncated glycash, and contacting the truncated glycash, that least one glycosyl transferase and at least one glycosyl color under conditions suitable to transfer at least one glycosyl donor content of the truncated glycash, thus remodeling the peptide. Conjugates can be formed between a granulocyte colony stimulating factor (G-CSF) peptide, interferon alpha peptide, interferon beta peptide, Factor VII a peptide, reactor IX peptide, follicle stimulating formone peptide, erythropoietin (BPO) peptide, interferon-gamma peptide, alpha-1-protease inhibitor (A-L-FI) peptide, interleukin-2 (IL-2) peptide, the saminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, the saminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, transminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, transminogen activator (TPA) peptide, anti-respiratory syncytial virus (RSV) F peptide, anti-respiratory syncytial virus (RSV) F peptide, anti-respiratory syncytial virus (RSV) F peptide, and modifying group, where the modifying group is covalently attached to the peptide through an inteact glycosyl linking croup. The method is useful for a cell-free, in vitto method of remodeling the above mentioned publice. The present sequence represents
                                                                                                                                                                                                                                                             Remodeling a peptide, by removing a saccharyl subunit from the peptide to form truncated glycan, and adding or deleting glycosyl groups to a peptide and/or adding modifying group of a peptide to remodel the peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             558 iligeledealilerililieladaaladelalilileeakaldealalieaakileide 500

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   334 TICAATIGICITITATCIGICGAGACTIGCITTGITTTGAAATATGTATTCAATTTIGG 392
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutant of blood coagulant factor VII, used for substitution therapy in the treatment of hemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to mutants of blood coagulant factor VII (FVII) or activated blood coagulant factor VII (FVIIa). The present sequence is the coding sequence for one such mutant FVII: VII-30. The mutants can be used as an agent for the substitution therapy of haemophilia inhibitor patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

deficient tissue factor (TF) compound that is modified to increase its deficient tissue factor (TF) compound that is modified to increase its biological half-life, but excluding modification that involves attachment to an antibody (or its antigan-binding region) that binds to a component invention are compositions containing any coagulation-deficient TF for promoting coagulation containing any coagulation-deficient TF for promoting coagulation are composition-deficient TF are used to promote coagulation preferentially in prothrombotic vessels, particularly those associated with: (i) bening growths (e.g. bening prostatic hypertrophy); (ii) vascularised, malignant tumours of medium or large size (where they also induce tumour necrosis, or (iii) other disorders that involve angiogenesis, e.g. diabetic retinopathy, restenosis, neovascular glaucoma, psoriasis and rheumatoid arthritis. The composition can be administered sytemically, particularly intravenously, typically at 0.2-coagulation, even though they contain no targeting agent. They cause little if any injury to normal tissue; may produce a symergistic response when used with other antitumour agents and they eliminate the multi-step, and expensive, preparation of antibody-based targeting constructs. The present sequence encodes human Factor VIIa, from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      334 TTCAATTGTCTTTTATCTGTCGAGACTTGCTTTTGTTTTGAAATATGTATTCAATTTTGG 392

The substance may be factor VIIa itself or an activator which promotes the conversion of endogenous factor VII to factor VIIa. (Updated on 25-MAR-2003 to correct PN field.)

The invention discloses a human factor VII polypeptide, or a variant or derivative of it, where an amino acid has been modified. This change cresults in a polypeptide with the same or an increased activity when cremplated by the the same or an increased activity when compared to recombinant wild type human Factor VIIa. Blood components that compists of a complex interaction of various blood components that compared to a fibrin clot. Initiation of the haemostatic process is mediated by the formation of a complex between tissue factor or and Factor VIIa (the active form of the Factor VII zymogen). This complex activates Factors IX and X, converting prothrombin to thrombin, which activates Factors VII and X, converting prothrombin to thrombin, which activates Factors VII zymogen, or its derivative, can be modified in its clot. The Factor VII zymogen, or its derivative, can be modified to clot. The Factor VII zymogen, or its derivative, can be modified in its clot preparing a medicament for the treatment of the Factor VII polypeptide to activate plasma factor X or IX. The factor VII derivative is useful for preparing a medicament for the treatment of bleeding episodes, for the channed actor X or IX. The factor VII derivative is useful for treatment of haemophilia A or B and for inhibiting thrombus formation. The inactivated factor VII derivatives are useful for treating intimal corpus, percutaneous transdermal coronary angioplasty (PTCA), stroke, cancer, tumour metastasis, analysis, arteriosclerosis, acute and chronic cheurations, such as inflammantion, septic shock, hypotension, adult corpusations, distress syndrome (ARDS) and myocardial infarction. The creations than a such contact and processed the contact than contact the contact than a syndrome (ARDS) and myocardial indication, distress syndrome (ARDS) and myocardial indication. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                334 ITCAATIGICTITIATCIGICGAGACTIGCITITITIGAAATAIGIATICAATITIGG 392

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a composition comprising a homodimeric immunoconjugate protein made up of two chains, each containing an 1gG1 FC effector domain and a targeting domain. The targeting domain may be either the human 1gG1 FC region or a mutant form of human factor VII. The immunoconjugate is targeted at the transmembrane receptor tissue factor. This enables the composition to be used in the treatment of diseases associated with neovascularisation, including cancer, atherosclerosis, rheumatoid arthritis and macular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                        Immunoconjugate protein for treatment of neovascularization, comprises protein comprising Fc region of human immunoglobulin (Ig)GI conjugated to the targeting domain which comprises factor VII mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; coagulation; Factor VII; Factor VIIa; blood coagulation; fibrin clot; haemostatic; tissue factor; zymogen; Factor IX; Factor X; prothrombin; thrombin; Factor V; Factor VII; fibrinogen; fibrin, plasma factor; bleeding episode; haemophilia A; haemophilia B; thrombus; intimal hyperplasia; restenosis; cardiogenic embolism; stroke; platelet deposition; percutaneous transdermal coronary angioplasty; PTCA; platelet deposition; percutaneous transdermal coronary angioplasty; PTCA; rheumatoid arthritis; arteriosclerosis; inflammation; septic shock; rheumatoid arthritis; arteriosclerosis; inflammation; septic shock; myoccardial infarction; vasotropic; cerebroprotective; antibacterial; immunosuppressive; cardiant; gene therapy; ds; plN174.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to disgnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 remucidaarcumcenaguescacemcarecemeaarcherecaremreneae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is one of a large number of 5' ESTs derived from manAs encoding secreted proteins. No ORF has yet been conclusively total human RAMS or DolyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences con a factived from the 5' ends and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. SETS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S. ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    63

                                                                                                                                                                            The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by
                                                                                                                                                                                                                                                                      analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed at feptimise. The present sequence catalon, the specification of the printed at figure this patent did not form part of the printed at fep.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer; cytostatic; carcinogen; pharmacodyanamic marker; marker; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                      The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                              83
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel serine proteases designated BSSP2 (AAB11695-B11699), and to nucleic acids encoding them (AAA61659-A61663).

The invention also relates to vectors and transformants comprising BSSP2 nucleic acids, transgenic animals in which the expression level of BSSP2 can be varied, and an mBSSP2 knockout meduse. The invention additionally antibodies, methods of BSSP2 and methods of production of such antibodies, methods of BSSP2 detection using the antibodies, and the use of BSSP2 proteins or fragments as diagnostic markers for certain medical conditions. Nucleotides encoding BSSP2 were initially isolated in a mouse brain cDNA library using degenerate PCR primers (AAA61673- AAA61674) based on conserved regions of serine proteases. The BSSP2 serine proteases and nucleotides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland and testis) as diagnostic markers for conditions such as Alzheimer's disease, epilepsy, cancer, inflammation, infertility and prostatic hypertrophy. Sequences AAA61659-A61662 represent cDNA encoding human BSSP2 (hBSSP2), and sequence 107 ragreacrecrecrecrecrateracaerricasecrereceeecrarecaecresces 166 85 26 TATITICITGAAGCCTCTGCTGGCAATACTTCTGGGGCTGCTGCCTTTCTCCCTGTCTGA Gaps .. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-08-321-777-3

Sequence 3, Application US/08321777

Patent No. 5504067

GENERAL INFORMATION:

APPLICANT: Morrissey, James H.

APPLICANT: Morrissey, James H.

APPLICANT: Treatnent of Bleeding with Modified

TITLE OF INVENTION: Treatnent of Bleeding with Modified

TITLE OF INVENTION: Treatnent of Bleeding with FVIIa

CORRESPONDENCE ADDRESS.

ADDRESSEE: Richards, Medlock & Andrews

STATE: 1201 Elm Street, Suite 4500

CITY: Dallas

STATE: Texas

CONTRY: US

ZIP: 75270-2197

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PATENTIN Release #1.0, Version #1.25

CURRENT APPLICATION NUMBER: US/08/321,777

FILING DATE: USMONTA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Sequence 7, Application US/08462261

Patent No. 5527632

GENERAL INFORMATION:
APPLICANT: Holly, Richard D.
APPLICANT: Holly, Richard D.
APPLICANT: Holly, Richard D.
APPLICANT: Foster, Donald C.
ITILE OF INVENTION: METHODS FOR PRODUCING THROMBIN NUMBER OF SEQUENCES:
ADDRESSEE: Townsend and Townsend
STREET: One Market Plaza, Stewart Street Tower, STREET: Twentieth Floor
CITY: San Francisco
STATE: CA
COUNTRY: USA
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 7, Ag
